

Way of working

Thanks to the previous assignments in this course, our group had already completed the *principles established* stage. Similarly, we had already decided on the key practices for the *foundation established* stage. We were only in the second stage for a short while, since we knew early on which tools we were going to use (Github, Lizard and Coverage.py). After having selected these tools, we entered the *in use* stage, in which we set up the basic structure and began working on the project. In this stage, we started selecting complex functions to analyze. In the *in place* stage, everyone agreed on how to execute the different tasks. This involved coming up with a consistent way to document the work. Right now we are in the *working well* stage, which is the most efficient and productive stage of our project. At this point, we all know what tasks to complete and how to complete them. Once we have presented our project and received our final grade for the assignment, we will enter the *retired* stage.

Throughout the past three assignments, we have improved in terms of key principles and practices. We now know how to operate Github in an efficient manner. This includes creating frequent issues, linking commits to these issues and creating many, short-lived branches for any type of update to the project. We have also become rather good at communicating through different channels. We have frequent meetings, a Discord chat for continuous discussion, as well as short conversations on Github in the form of comments.
